AAG and IAAG PROGRAMMING UNIT

Acoustic profile programs are downloaded from a personal computer to the stand-alone Programming Unit, which is then used to transfer the information to individual AAGs or IAAGs as required, either directly or via the Programming Extension Cable.

The self-contained programming unit is powered by its own rechargeable battery, and contains a four line display, three control buttons and input/output connectors. It is supplied with a purpose built Power Supply (Battery Charger) assembly, and a Serial Cable for connection to a Personal Computer.
